MyNaksh — Personalized AI Context Engine

Stateless API over a pure engine · two swappable ports · resilient, cached, observable

Flow: client → API (validate) → engine classifies intent (keyword; LLM fallback for Tamil / Tanglish) → fetches only the needed services concurrently → builds an optimized, grounded prompt → LLM (response-cached) → assembles **answer · confidence · sourcesUsed**. An upstream failure lowers confidence — it never 500s.
